

## **PRESS RELEASE**

**May 2001**

### Jardine to market CARA-FaultTree package

Jardine Asset & Risk Management Solutions and Sydvest have signed an agreement for Jardine to market Sydvest's CARA-FaultTree package.

Fault Tree analysis is a highly recognised method for reliability analyses for all types of systems. The Fault Tree is constructed so that you can effectively determine how a system could malfunction and the analysis shows the effect of the different components on reliability. The CARA-FaultTree package is all one needs to implement Fault Tree analysis. This tool compliments Jardine's existing portfolio of asset performance dynamic simulation packages (ACE, MAROS, TARO and TRAIL).

Jardine Asset & Risk Management Solutions provides software tools and consultancy services for overall plant availability and reliability performance simulation modelling, including high-level asset performance modelling.

Sydvest is a Norwegian based software house, providing tools for analysis and management of safety and reliability.
